SetEditPingulux for Edision Argus Pingulux

Contents:

1 General

SetEditPingulux is a program to change the settings (program sequence, names of channels etc.) of the Edision Argus Pingulux digital satellite receivers.

You can easily make your own channel lists, edit them, print them and write them into your receiver. You can enter new channels or new transponders, edit, delete and save them, change the names of channels, sort, search, copy and paste channels.

With SetEdit you can edit settings of different receivers, exchange channels between settings files of different receivers or convert a settings file of one format into another (e.g. SetEditDVB2000 into SetEditPingulux).

You also have the possibility to create a personal wish list for your settings and then adapt any settings file (if you have got the corresponding SetEdit full version) to this wish list and write it into the receiver.

The settings are read from the receiver and written into the receiver via the network port with a network cable.

With this program you can't change the receiver firmware; to do this, please use the tools you can find on the Edision Argus Pinulux homepage.

In the following guide you will find a step by step description of how to use this program. In the other chapters there is a short description of all functions divided in file, channel, provider, satellite, transponder and favourite list functions and the configuration.
2 Installation

System requirements:

PC with Windows NT/2000/XP/Vista, a network connection and 20 MB of free disc space.

<u>First Installation</u>:
If you like to install SetEdit for the first time, please start the file SetEditPingulux_installation_en.exe.

In this window you can select, if you get in addition to the program a desktop shortcut and an entry in the start menu. Furthermore you can select that after the installation SetEdit is launched and/or the SetEdit directory is shown in the explorer.

When you click on "Next", you can select the installation directory.

The installation contains the program itself, some pictures and a sample settings file.

There are no changes made to the Windows system files.

You will also find the file SetEditPingulux.ini in this directory. Your personal configuration is saved in this file.

If you have more than one receiver (with the right DLL modules), you can decide with which type of SetEdit the program should start. You just have to change the name of the exe file. Example: If you start SetEditPingulux.exe after the installation of SetEditPingulux_installation_en.exe the program will start as a Edision Argus Pingulux editor. If you change the name of the SetEditPingulux.exe file into SetEditDVB2000.exe, the program will start as DVB2000 editor. Of course you can open additional SetEditPingulux if required.

<u>Add other editors</u>:

With SetEdit you can convert all settings formats that are supported by SetEdit and for that you have got the corresponding editor (in form of a DLL file) into any other supported format.

In the following example I assume you have already installed a Topfield editor and want to add a Humax editor

To add the Humax editor to your already existing Topfield editor, you have to select the Humax receiver on my homepage

Here you can download the upgrade in form of a zip file. (You can either start the installation immediately or save this file on your hard disc first.)

Extract the zip file and enter the directory of your Topfield installation as destination directory. You can also drag the files with drag&drop to this directory.

You can open this directory, if you click on the help button in the main program and then select "Open SetEdit directory" from the popup menu.
The Humax DLL file and the Humax documentation now appear in your SetEdit directory.

Now please close all SetEdit editors and restart the program.

*Note: to convert a settings file **into** another SetEdit format, you have to buy the corresponding license first.*

Deinstallation:

To uninstall SetEditPingulux simply delete all files, which are in your SetEdit directory.

3 Step by step

I assume that the program has been installed on your PC as described in chapter 2.
Also it is assumed that you are using SetEditPingulux for the first time. In the following I will describe how to transfer the settings from the receiver to the PC and back (chapter 3.a and 3.f). By means of examples you will see how to get order in your settings (chapter 3.b), how to use the provider functions (chapter 3.c), how to put channels into the favourite lists (chapter 3.d), how to work with the transponder menu (chapter 3.h), how to enter new channels by hand (chapter 3.h), how to handle the peculiarities of German Premiere World channels (Formula 1, soccer, pay-per-view) (chapter 3.h) , how to adjust settings from other receivers (chapter 3.i and 3.j) and from DXAndy (chapter 3.k) to your requirements and how to convert one settings format into another (chapter 3.j) , how to create a personal wish list and then adapt settings to this wish list (chapter 3.l).

3.a Load and back up a settings file

Read settings from the receiver:

Please connect your receiver to the PC with a network cable.

If you start SetEditPingulux for the very first time you will get a window with the history of the changes from previous versions.
The first thing you should do is to make a backup of the channel settings in your receiver. You can restore such a backup at any time into your receiver and the receiver will be the same as it was at the time you made the backup.

To do this you have to enter in the configuration your network parameters. Please click on the button "Config."
You will get the following dialogue:
(Here you find four pages. Please click on "Network" to enter the network data. You get the following window.)
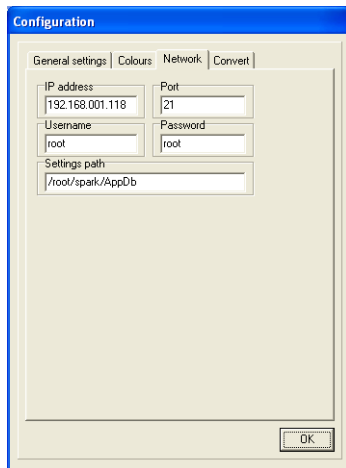

Here you have to enter in the field IP address the IP address of you receiver (you find the IP address in the receiver with Menu -> System -> Network). Usually port 21 is used for the FTP connection, please change this value only if you really know that another port is used. The username is usually "root" and the password for the user root is root (if you did not change it). The path, where the settings are found, is "/root/spark/AppDb".

When you have entered these parameters, please click on "OK".

All other options of this menu are explained in chapter 5.b in details.

Now click on the button "file". You will get the following menu:
Here you select the function "Read from receiver", and you get the following message:
When you have clicked on "OK" in this message, a second message will appear. When you have followed the instructions in this message the settings will be read from the receiver and saved on your hard disc.

The settings are now read from the receiver and you see the data in SetEditPingulux.

Save settings:

To save your settings, please click again on the button "file" to open the file menu but now select the function "Save as". You get the following dialogue:
Here you have to enter the directory and filename of your back up.
As soon as you have clicked on "Save" in this dialogue, the data is saved in this file.

If you make some unintentional changes in your settings when you experiment with SetEditPingulux you can always restore this backup file into your receiver and reverse any changes.

Now you can change your own settings file, which is already visible in SetEditPingulux, or you can adapt a settings file from your hard disc (e.g. from the Internet) to your own requirements and write it into your receiver (chapter 3.i and 3.j).

Load a settings file from your hard disc:

If you want to adapt a settings file from your hard disc (e.g. from the Internet) to your own requirements and then write them into your receiver, you have to load these settings first. Please click on the button "File" and then select the function "open" from the file menu.
Now please select the file you want to load from the list you see
and click on "Open" or double click on the file you want to load.

Note: If you want to write settings that you have found in the Internet into your receiver, you have to be careful:
A settings file does not only contain the channel information, it also includes the LNB and the satellite configuration. These configuration settings will usually not fit to your receiver.
Therefore you should better overwrite these configuration settings with your own configuration settings (see chapter 3.j or 5.e.)

When you have loaded a settings file or read the settings from your receiver, you get the following window (depending on the window size and some personal settings the picture may differ).
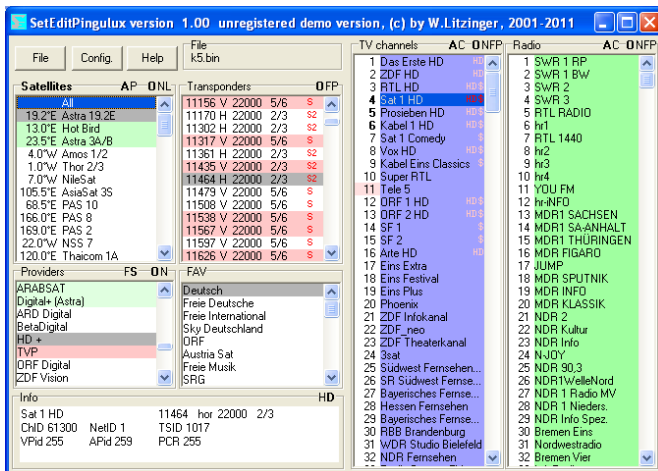

You see the TV channels (light blue background) and the radio channels (light green background) as well as a transponder list, a satellite list, a provider list and the favourite lists (FAV).

If you select an item in the satellite list, you will see all channels and all transponders that are assigned to this satellite.

If you select a transponder, provider or a favourite list, you will only see the channels that are assigned to this transponder, provider or this favourite list.

When you select a channel, the satellite, transponder, provider and FAV list (if the channel is in a FAV list) of this channel are marked grey.

Channels that are in a favourite list are marked in the channel list with a darker background colour.

Transponders and providers marked in red are empty; they contain no channels.

If the channel number is marked with a red background colour, the channel is assigned to a vertical polarised transponder. If the channel number has a white background colour, the channel is assigned to a horizontal polarised transponder.

If a satellite has a green background colour, it is activated, which means there are already channels on this satellite.

(You can change all these marking colours in the configuration menu, see chapter 5.b.)

When you click with the right mouse button in the channel list (TV or radio) and select from the popup menu the entry "Info" you will get the number of TV channels, radio channels, transponders, satellites and providers that are in your settings.

SetEditPingulux

You have:
TV channels: 295
Radio channels: 718
HD Channels: 104
Scrambled: 328
Locked: 0
Skipped: 0
FAV channels: 411
Extra: 0
Unwanted: 0
Satellites: 65
Transponders: 384 (4000)
Providers: 113
Total: 1013 (8000)

Selected:0

[OK]
3.b Arrange settings

Now you have the settings (from your own receiver or from the Internet) in SetEditPingulux.
The most important functions will be explained now in detail with some examples, while in the chapter functions all functions are briefly described.

The most important function of SetEditPingulux is to get order in your channel list. This can be by deleting channels you don't need (e.g. channels that are scrambled and you have no subscription for), getting the channels into a useful order, assigning the channels to the favourite lists or the providers and correcting wrong channel settings (e.g. wrong channel names).

First let us suppose that we want to delete a channel. To do this we have to select the channel first. Please click with the mouse on the channel. Then the satellite, the transponder, the provider and the FAV list(s) (if this channel is in a FAV list) of this channel are marked grey in the respective list. Sometimes it is useful to change this colour (similarly for other colours, for example the colours used for new channels (for the import) or duplicate channels), e.g. because the colours are too pale on a laptop. You will find a description how to do this in chapter 5.b.

Now click with the right mouse button in the channel list and open the channel menu:

Info	Alt+I
Show	▶
View sorted by	▶
Change data	Return
Delete	Del
Copy	Ctrl+C
Paste	Ctrl+V
Move to	Ctrl+M
Swap channels	
Select	▶
Invert selection	Ctrl+I
Mark as	▶
Mark new channels in	▶
Remove new channel markings	
Mark not existing channels in	▶
Remove not existing channel markings	
Sort	▶
DISNEY CHANNEL -> Disney Channel	Alt+Y
Find channels	Ctrl+F
Find duplicates	Ctrl+D
New	Ctrl+N
✔ Split	Ctrl+T

Please select the item "delete" in this menu and the selected channel will be deleted from your settings.
If you delete a channel within the favourite list, this channel is only removed from the FAV list but not deleted from the main list.

Note: There is no undo function yet, so be careful.

To delete a channel, you can also select the channel and then hit the Del key on your keyboard.

To delete multiple channels please click for example on channel 5, then press the shift key and keep it pressed and then click on channel 7. The channels 5 to 7 are now selected. Now you can delete these channels as described above.

To select channels that are not consecutive (e.g. the channels 5, 20 and 39) please click on the first channel (here channel 5), then press the Ctrl key on your keyboard, keep this key pressed and then click on the other channels you like to delete.

Now assume we want to move a channel, e.g. ZDF to position 2.

Note: You can show your channel lists in original order or sorted by alphabet, frequency or polarity. Moving channels is easier when the channel list is shown in its original order. If the channel list is shown in alphabetical order and you move a channel, only the channel number will change but not the position of the channel in the channel list (the name is still the same). To show the channel list in original order, please click with the right mouse button into the channel list and select from the menu

item "View sorted by" the option "Original".

Info	Alt+I
Show	▶
View sorted by	▶
Change data	Return
Delete	Del
Copy	Ctrl+C

✔ Original	Shift+Alt+O
Names (alphabetic)	Shift+Alt+N
Frequency	Shift+Alt+F
Polarity	Shift+Alt+P
To change the viewing mode of the channel lists you can also click on the letters "O" (original), "N" (Name), "F" (frequency) or "P" (polarity) in the border of the channel lists.

First we have to find out the position of the channel ZDF at the moment. To find all channels you first have to click on the satellite "all" to see really all channels, independent of the satellite the channels belong to. Then you can search for ZDF by entering the first letters of the channel name. Please click anywhere in the channel list and hit the "Z" key on your keyboard, now all channels whose names begin with "Z" are selected. Now hit the "D" key on your keyboard. Now all channels beginning with "ZD" are selected. You can do this of course with the third, fourth letter etc. If you wait for more than three seconds between two letters a new search is started, so that the last letter entered is taken as the first letter of the name that is searched.

You can also use the "find channels" function to find channels by name. Open the channel menu and select the function "find channels" from this menu. You will get this window:

Find channels

☑ All satellites
☑ Substring

Name
[spo]   Cancel

You can choose whether you want to search on all satellites or only on the actually selected satellites. Click on the field beneath "all satellites" to search on all satellites (if you have selected "all" in the satellite list you won't see this option because all satellites are searched anyway).

If you now enter "ZDF" in the field "Name" you will see in the list above all channels whose names begin with "zdf", e.g. the channel ZDFtheaterkanal.
If you click on the white square to the left of the text "substring" you will see all channels that include the entered letters as a part of the channel name (beginning, middle or end, upper/lowercase is ignored). If you enter for example the word "sport" the channel "Eurosport" is found too.

Now you can move channels from this list to another position in the channel list or assign them to another satellite, transponder, provider or a favourite list. The channels will not be removed from the find list, but when you click on such a channel you will see that the new satellite, transponder, provider or the new favourite list is now marked in grey.

Within this find function you can also delete channels. Simply select the channel in the list of the find function and hit the Delete key on your keyboard.

Now you have found for example ZDF. There are several ways to move the channel.

The first way is to move the channel by drag & drop: click with the left mouse button on the channel you want to move, keep the mouse button pressed and drag the channel to the position you like to have it. The channel will be placed in front of the position the mouse is on.
To drag a channel on the last position in the list, you have to drag it <u>behind</u> the last channel.

You can also move the channels with the arrow keys of your keyboard. Please select the channel(s) you want to move, then press the Ctrl-key on your keyboard and keep this key pressed. Now you can move the selected channel(s) with the arrow keys on your keyboard. If you press the key "Home" or

"End" while the Ctrl key is pressed you move the selected channel(s) to the beginning or the end of the list.

With both methods described above you can move of course more than one channel.

Another possibility is to move a channel directly to a position (e.g. channel 20 to position 5). Please select the channel, then click with the right mouse button in the channel list and select from the channel menu you get the function "Move to", the following dialogue appears:
Here you can enter the channel number you like to move the selected channel to (in this example 5). The selected channel will be moved now in front of the channel that was previously at this position. If for example KABEL1 had a channel number higher than 5 before, it will be moved to channel 5. If the channel had a lower channel number before (e.g. 3) the channel will be moved in front of the channel that was at position 5. Because one channel is now missing in the list (the channel you are moving) all channels are moved up one position (i.e. to lower numbers), so in this case your channel will be moved to position 4.

Especially if you use the drag & drop method it is often a problem that not all channels can be seen on the screen, so you have to scroll. If you want to move a channel from position 500 to 10 you have to keep the mouse button pressed while you move to position 10. If you move the mouse some pixels up and down at the border of the list, then the list will scroll in this direction.

There are some functions that make moving channels more comfortable. For example you can hide one of the lists (TV or radio) to have more space for the channels. You can even hide the satellites, transponders, the providers, the favourite lists and the data window. Please call the channel menu and select on "Show" what you want to see (TV, Radio, TV and Radio, "Show only channels" or "All lists").
If you double click on the name of a channel list the other list will be hidden.

With a second double click on the name you will see both lists again.
When you click on the letter "C" in the border of the channel lists, the satellites, transponders, the providers, the favourite lists and the data window are hidden. When you click on the letter "A", you will see all lists again.

Another function that makes moving by drag & drop easier is the "split" function. Please click with the right mouse button in the channel list to open the channel menu and select the function "Split" from the popup menu.
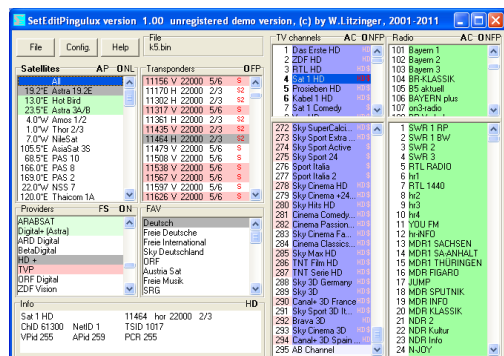

All channel lists (depending on what is shown/hidden) are now shown twice. It is of course the same list, but you have two different views of it. Changes in one of these lists will affect the other list too. You can move channels from the upper list to the lower list, because it is the same list but from different points of view, the entry is changed in both windows.

If you make many changes to the channels, please remember to save from time to time. To do this hit the "file" button. From the file menu please select the item "save" to save the file. If you want to keep your original file and save the file with a different file name, you should use the "save as" function in the file menu. Enter the file name and click on the "save" button.

With the function "Sort" in the channel list menu, you have several possibilities to sort the channels.

Find duplicates	Ctrl+D
New	Ctrl+N

Submenu for Sort:
- Sort by alphabet
- Sort by frequency
- Sort by Service ID
- Sort by polarity
- Sort channel list by Satellites
- Sort channel list by providers

Contrary to the function "View sorted by" the channels are not only shown in a different order, they also get another channel number. You can sort the complete channel list by providers (see chapter 3.c) or by satellites. This may be helpful if you have got a motorized dish. If you have sorted your channel list by genres for example, your dish would always move between the different satellite positions, when you zap in your channel list.

If you want to sort channels alphabetically, by frequency or polarity, you first have to mark the channels you want to sort.

3.c Provider

In chapter 5.d there is a short summary of the provider functions.

It is possible to create new providers that can be used to combine channels that usually belong to different providers. This enables the SetEdit user to group channels without using the favourite lists.
To create a new provider, you have to click with the right mouse button in the provider list, you will see the following menu:

Now please click on "New", you get the following message:

Here you have to enter the name of the new provider (e.g. Sport).

The new provider is marked in red colour because it is empty.

You can also change the name of an existing provider. To do this, you have to select the provider and select the function "Change name" of the menu shown above (you can also make a double click on the provider). You get a dialogue, where you can enter the new name.

Because self-created providers are often used you can move this provider - same as channels - within the provider list. You can move it with the Drag&Drop function or while the Ctrl-key is pressed with the arrow keys of your keyboard and the keys Pos1 and End.

Now you can move channels from different providers to your new provider. It is recommended to select the satellite "all" to see all channels. Now select a channel you like to assign to your new provider and move it by Drag&Drop on the name of the desired provider.

You can also change the provider of a channel in the channel data menu, (see chapter 3.e).

Often you can't see all providers at once in the provider list, so you have to scroll the provider list. To do this while you try to drag a channel to a provider just move the mouse towards the border of the provider list, then the list will scroll towards this direction.

If you want to move many channels to one provider it is easier to fix the provider list. To do this click on the "F" in the frame round the provider list.
Now the provider list does not jump to the provider of the selected channel.
If you want that the provider list scrolls to the provider of the selected channel again, click on the "S" in the frame around the provider list.

A channel can only be in one provider. Sometimes you would like to have a channel in more than one provider. To do this you can create channel duplicates (which will have different channel numbers).
To create a channel duplicate please click on the channel you like to create a duplicate of, then open the channel menu and select "copy" from this menu. Now select the desired position of the duplicate in the channel list and select "paste" from the channel menu. The original channel and the pasted

channel are now marked red to show you that this is a duplicate channel. If you don't want to open the channel menu every time you can also use shortcuts for these functions, Ctrl-C is for copy and Ctrl-V is for paste.

There are two ways to find such a duplicate later:

When you move the mouse over a channel that is marked in red, you get a hint showing the number of a channel that is a duplicate of this channel.
To find such a channel, first click on the channel list, then you can enter the channel number from the keyboard, so if you hit the key "1" channel 1 will be selected, "1" + "4" will select channel 14 etc. As with finding the channels by name, you have to enter the numbers within 3 seconds, otherwise the last entered number is taken as the first digit.

You also have the possibility of using the "Find duplicates" function. Click with the right mouse button in the channel list and select "Find duplicates" from the popup menu you get. You will see the following window:
All duplicates are shown. The different pairs of duplicates are marked in different colours. This function does not distinguish between different types of channels, i.e. it can happen that you see a pair of TV channel duplicates first and then a pair of radio channel duplicates. Relevant for this search are the transponder data and the channel ID, but not the name. If you activate the option "PIDs", the video, audio and PCR PIDs are compared too.

For the "Find duplicates" window there are the same functions as for the "Find channels" window, i.e. you can delete and move channels from this window into another list and select if the duplicates are searched on all satellites or only on the selected satellite.

To remove providers from the provider list there are three functions in the provider menu:

- You can use the "Delete all empty providers" function to delete all providers that don't contain channels.

- With "Delete" you can delete a selected provider with all channels that use this provider. You can also hit the "Del" key on your keyboard.

- With "Remove Providers" you can delete a provider from the provider list, without deleting the channels too. The channels, which used this provider, will stay in the channel list and are assigned to the provider "---".

If a provider only contains TV channels, it is shown in the provider list with a light blue background. Providers with only radio channels have a light green background colour. If a provider contains both channel types, it has a white background. Empty providers are marked with a red background colour.

When you have created a new provider with you 20 most important channels, the channel numbers will be more or less random in this provider. You have your most important channels at on glance when you open the channel menu in the receiver, but zapping is difficult. The solution for this problem is to move your new provider to the first position of the provider list, open the channel menu and select the function "sort" -> "sort channel list by providers". Now the channels are sorted in the order they appear in the providers. Your 20 most important channels for which you have created your own new provider are now channel 1-20 and in the next provider you will find channel 21 to ...

Another possibility to sort channels is to sort them by satellites (see chapter 3.b) or to sort them

alphabetically or by frequency or polarity.

3.d Favourite lists

The Edision Argus Pingulux receivers have 32 favourite lists for your favourite channels. The advantage of favourite lists is that you can put a channel in more than one favourite list without the necessity to create a duplicate of this channel (with the consequence that one channel has two different channel numbers). This can be useful for families because every family member can create his/her own favourite list.

To assign one or more channels to a favourite list simply move the selected channels by drag & drop on the name of the favourite list.

To remove one or more channels from a favourite list you first have to select the FAV list you want to remove channels from. Then select the channels you like to remove and select "Delete" from the channel menu or hit the "Del" key on your keyboard.
When you delete channels from a favourite list, the channels are only removed from this favourite list but not from the main list.

You can also use the "Mark as" function in the popup menu of the channel list to assign one or more channels to a FAV list or remove them from all FAV lists.

Channels that are in a favourite list are marked in the channel list with a darker background colour. To change this colour please see chapter 5.b.

Within a FAV list you can change the order independent of the order in the main list. If you change the channel order within the FAV list by using the drag & drop function you will only change the order within the FAV list but not the order of the main list. In opposite the order within the FAV list is unchanged when you change the order within the main list.

To change the name of a FAV list please make a double click on the FAV name, you will get the following window:
Here you can enter the name of the FAV list.

With the "export" function in the popup menu of the favourite lists you can save a favourite list to your hard disc.

With the "import" function you can ad this favourite list to another settings file. If there are one or more channels in the favourite list which haven't been in the settings file before, these channels and the corresponding transponders will be added.

3.e Channel parameters

To rename a channel (e.g. "Das Erste" to "ARD") please select the channel and choose from the channel menu the function "change data" (or double-click on the channel), then you get the channel data menu:
In the field "Name" you can now enter the name of the channel.

Within this menu you can also assign the channel to another provider.

Furthermore you can change the transponder data (frequency, polarity, symbol rate, FEC, Net ID and TS ID) the PIDs and the Channel ID of the channel (see chapter 3.h).
For some transponder types these boxes will change. E.g. for DVB-C (cable) transponders there is no FEC and no polarity, but you have to enter the modulation.

With "PIDs" you can choose whether the PIDs are shown decimal or hexadecimal.

You can also mark channels as "scrambled", "locked", "skipped", "unwanted" or "extra" within this menu or remove these markings.
If you lock a channel this means you have to enter the parental pin to watch this channel. These channels will be marked in the channel list with a key symbol. A skipped channel is marked with an X and is skipped when you zap with the arrow keys, you can enter it directly in the receiver channel menu or by entering the channel number. Scrambled channels are marked with the following symbol:
$

Note: If you remove the scrambled symbol this does not mean that the channel can be watched for free. This is just the marking of the channel.

If you mark a channel as unwanted, this channel will be shown in the channel list with a grey font and will be marked with a red minus. Extra channels will be marked with a red plus.
You need those markings (Extra and unwanted) for the wish lists functions (see chapter 3.l).

Caution: If you save a settings file, all unwanted channels and transponders are deleted. And the markings for extra channels will disappear too.

In the field "Service Type" you can change the type of the channel (TV, radio or HDTV).
HDTV channels are marked with "HD" in the channel list.

Note: Channels that have the service type "TV channel" or HDTV channels only appear in the TV list, "Radio channels" only in the radio list.

With the function "mark as" from the channel list menu you can change the following properties for more than one selected channel at once. You can:
-Mark channel(s) as "(un)locked", "(not) skipped" or "(un)scrambled"
-Assign channel(s) to a service type
-Assign channel(s) to a FAV list or remove it/them from all FAV lists
-Remove channel(s) from their providers (provider "---")
-Mark channel(s) as "(not) linked", "(not) unwanted" or "(not) extra" (wish lists)

-Mark the transponders or the selected channels with all their channels as unwanted (wish lists)

Nova

Many channels are only shown in uppercase letters. To change this, you don't have to enter a new name for each channel. Simply select the channels whose name you want to change and select the function "DISNEY CHANNEL -> Disney Channel" from the channel menu.

The first letter of the individual words is never changed by this function. If mixed upper/lower case letters occur in the word, nothing is changed (example: EinsMuXx). Words with less than 4 letters are also not altered, so that abbreviations such as CNN stay unchanged.
In the file SetEdit.ini there are lists of exceptions (which can be changed) to these rules. There is a list of 10 words that are not converted although they contain more than 3 letters, (example: ESPN, CNBC) and a list of 10 words that are converted although they are shorter than 4 letters (example: "CO" so that from KRIMI&CO you get Krimi&Co).

The reasons why you might be interested in changing the channel names to lower case are that mixed-case writing is easier to read and lowercase letters are often narrower than uppercase letters, so that when you have more lower case letters in the channel name more letters can be shown in the channel list of the receiver. Channel names that do not fit within the channel list are truncated.

3.f Write settings into the receiver

When you have finished making your personal settings you have to write them into the receiver before you can use them. To do this, please click on the button "File" and select the function "write into receiver" from the file menu.
You get the following message:
Note: If you have used the wish list functions there may be some specials to take care about. Please read chapter 3.l.

3.g Print or export settings

You can print your settings. To do this click on the "File" button and select from the file menu the function "Print". You get the following dialogue:
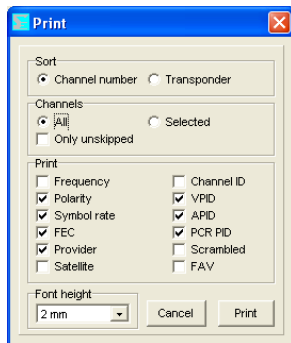

First you have to select if your printout should be sorted by channel numbers or by transponders (frequencies).

If you print your channels in number sequence, you can also select whether you want to print all channels, only the selected ones or only the unskipped channels.

There are some options. You can choose if you also want to print the frequency, the satellite, the PIDs, if the channel is scrambled or if the channel is in a FAV list, etc.

Finally you can enter the Font height for your printout. Then please hit the button "Print". A printing dialogue will appear, whose layout depends on the printer you have installed.

With the "export" function you can export your settings to a plain ASCII file that can be opened with Word or Excel or other applications. The tab character (0x09) separates the different parameters.

Besides this the export works the same as printing. Select "Export" in the file menu, then you select the optional parameters as described above and click on the button "Export".

You get a window where you can enter the filename and select the directory of the exported file.

3.h Using the transponder functions and entering new channels by hand

There is a short summary of the transponder functions in chapter 5.f.

Possibly when you read the settings from your receiver you wondered about channels with strange names and that some channels were missing in your list (e.g. German Premiere, soccer, Formula 1 or pay-per-view channels).

Channels that share place (like the German ARTE/Kinderkanal) can only be found in the receiver if they are active at the time you make the channel search. Some of the Premiere Direkt, soccer and Formula 1 channels are found, but not with the right name.

In the following you find a description how to enter new transponders (and channels) and how to change wrong transponder data.

In the Internet there are sites (e.g. www.lyngsat.com) where you can find all channel settings (including the missing pay-per-view or soccer channels). In the following you find an explanation how to enter channels and transponders from such lists by hand.

Suppose you discover on www.lyngsat.com that on satellite X a new transponder is active, but your receiver can't find this transponder at the moment, for example because it does not send at the moment (feed) or your antenna is not aligned to this satellite.

Here we see that transponder 12656 horizontal is new and one scrambled TV channel (Anem, the orange background shows you that the channel is scrambled) and two audio channels (B2-92 with two different audio PIDs) are active on this transponder.

Now you have the possibility to create a new transponder first and then enter the channel on this transponder. Or you can directly enter a new channel with the right transponder data on the satellite. Both methods may be useful, so both will be described in the following:

To create a new transponder, you first have to select the satellite of this transponder. Then you click with the right mouse button in the transponder list and select in the transponder menu the function "New" -> "Transponder". You see the following window:

For the example mentioned above you enter 12656 for the frequency and HOR for the polarity. The symbol rate in this case is 2963. In this example the FEC is 3/4.

The green numbers in the Lyngsat chart are the NETwork ID and the TS ID (here NET ID = 0 and TS ID = 176).
These two IDs identify the transponder. The Net ID identifies the provider; the provider sets the TS ID in any way he likes. If a provider has more than one transponder on one satellite, the Net ID is always the same and the TS ID differs.
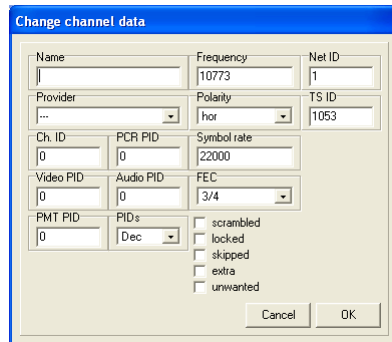

With "Type" you can change the transponder type.

Please confirm with OK then you will find the new transponder at the end of the transponder list.

Note: Some boxes are only visible for certain transponder types, e.g. "Pilot" for DVB-S2 transponders.

Now you can enter the new TV and radio programs on this transponder.

To do this select the new transponder and click with the right mouse button in the now empty channel list and select the function "new" from the channel menu you get. You get the following window:

You can also click with the right mouse button in the transponder list (the new transponder has to be selected too) and with "New" you can select the function "TV channel on this transponder" or "radio channel on this transponder".
You will get the same window.

The correct transponder is already entered.

If you want to enter a channel directly, please select the satellite for this channel, click with the right mouse button in the channel list and select the function "New" from the menu you get.
You will get the same window as with the other method again, except that in this case the transponder data has to be entered in the fields "Frequency", "Polarity", "Symbol rate", "FEC", "TS ID" and "Net ID".

In the field "Name" you can enter the name of the channel (here "Anem").

Then you have to enter the PIDs and the channel ID.

In the field "Provider" you can change the provider of this channel.

The TV channel "Anem" for example (see list above) has the video PID 4194 and the audio PID 4195. The channel ID (service ID) is 1 and the PCR PID is as a rule identical to the video PID, so don't forget to enter it!

For the Audio (radio) channels of course no Video PID is given. Usually you use the VPID 1FFF (hexadecimal) or 8191 (decimal) to indicate that this PID is not used.

The PMT PID (Program Map Table) identifies and indicates the locations of the streams that make up each service, and the location of the Program Clock Reference fields for a service.

If you don't find this PID, you can enter 1FFF (hexadecimal) or 8191 (decimal) instead, i.e. "not used". For "normal" channels you don't need this PID.

In the field "Service Type" you can change the type of the channel (TV, radio or HDTV).

When you have entered all the parameters please click on OK and the new channel will appear at the end of your channel list.

If you only want to change some of the parameters of a transponder (e.g. because the TS ID and/or the Net ID are wrong), you simply have to select the transponder, click with the right mouse button into the transponder list and select from the menu that appears the function "Change data". You get a dialogue where you can change the parameters of the selected transponder. (You can also make a

double click on the transponder to get this dialogue.)

As soon as a satellite has one channel it is shown as being active (appears in green). Satellites that have no channel have a white background. (You can change these colours in the configuration.)

If you want to enter channels that differ only in few parameters, it is useful to create a duplicate of a channel (please use the copy and paste function from the channel menu) and then change only the different parameters.

Note: In some lists the PIDs are given in decimal notation, in others in hexadecimal notation (see chapter 8). You have to be aware of that when you enter the PIDs. In the configuration menu and in the channel data window you can specify if you want to see/enter the PIDs in decimal or hexadecimal form.
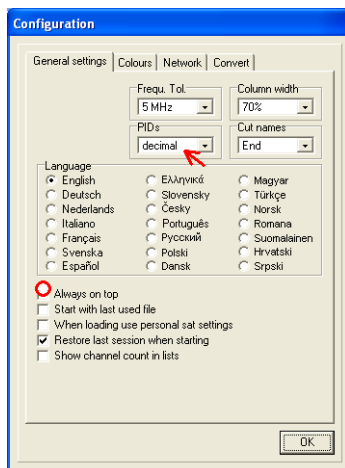

When you enable the option "always on top" in the configuration menu, SetEditPingulux will always be in the foreground on your desktop. This can be useful when you work with such Internet lists, as the SetEdit window will not go into the background when you click in the browser.

You also change the notation of the PIDs if you click on the "H" for hexadecimal or "D" for decimal in the border of the "Info" section.

To compare your settings file with lists in the Internet that are often sorted by frequencies you have the possibility to sort the transponders of your settings file by frequency. To do this click with the right mouse button in the transponder list and select "view sorted by" -> "frequency" from the menu you get. Alternatively you can also view the transponder list sorted by polarity.
You can also set the viewing mode by clicking on the letters "O" (original), "F" (sort by frequency) and "P" (sort by polarity) in the frame of the transponder list.

3.i Import of channels

You have the possibility to get ready-made settings lists from the Internet. These lists can be used partially or completely. You can find such lists for example at the following URLs: www.dxandy.com or on the SatcoDX site (you can find a link on my homepage).
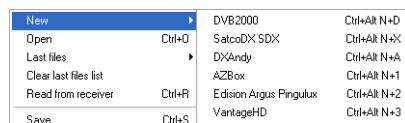

There are three possibilities to use such settings files. In this chapter you find a description how to add some channels from an other settings file into your settings file.

The import function

You can import channels from all settings formats that are supported by SetEdit into your SetEditPingulux settings. In the standard version you can import channels from SetEditPingulux settings, DVB2000 settings, DXAndy and SatcoDX SDX files.

You can add other formats by copying the corresponding modules (SetEditXXX.dll) into the SetEdit directory (see chapter 2.)

Please click on "File" -> "New" and select the format of the settings file, from which you want to import channels.

A second window with the chosen settings file will be opened. In the same way you can open a third or even more settings files. Each of these lists is equivalent. Every format (Edision Argus Pingulux, DVB2000, SatcoDX, DXAndy or other added formats) has its own symbol.
SatcoDX and DXAndy files are only Internet lists, so the functions "Read from receiver" and "Write into receiver" do not exist for these formats.

Now you can easily transfer one or more channels by drag & drop from one window into another or "Copy" and "Paste" them with the corresponding functions from the channel lists menu.

Note: As the Edision Argus Pingulux receivers only support digital channels you can't import analogue channels. It may happen, that there are analogue channels for example in a SatcoDX file.
In the configuration of the SatcoDX settings file you can choose, if you only want to see analogue or digital channels or both.

In the different settings formats there are different channel parameters. If a parameter only exists in the destination list but not in the source list (e.g. there are no PMT PIDs in the SatcoDX files), a standard value will be taken for this parameter.

You can also drag and drop groups of channels (for example entire transponder with all its channels) from one window into another.

Source:

Channel list: The selected channels will be transferred.

All other lists (satellites, providers, labels, transponders, etc): All channels of the selected list will be transferred.

Find window (e.g. "Find channels", "Find duplicates"): the selected channel will be transferred.

Destination:

Channel list: The imported channels will be pasted at the location the cursor is on at the moment you

paste the channels. Sometimes it is only possible to paste a channel, if a definitely assignment (e.g. to a satellite) is possible in the destination list. In a SetEditPingulux settings list a satellite has to be selected, if you want to paste a channel. If the entry "All" is selected in the satellite list, you can't import channels from another window.

Transponder: A transponder is always definitely assigned to a satellite. So if you assign a channel from another window to a transponder, these channels will be assigned to the satellite of this transponder and will get the transponder data of this transponder.
If you drag and drop a transponder from one window into the transponder list of another window, this transponder with all its channels will be added as a new transponder.

Note: If you import a transponder from another window, this transponder will be added to the satellite that is selected. If "All" is selected in the satellite list, the new transponder will be added to the satellite of the transponder the cursor is on.

If you drag and drop a satellite with all its channels to the transponder list of another window, all these channels will be added to the transponder the cursor is on. This will also happen to channels that come from another FAV list, provider, label, etc.

Note: It may happen that you can't receive a channel, if you assign it to the wrong transponder.

Satellite: The imported channels will be added to the satellite the cursor is on. Transponders that don't exist yet in the transponder list of the destination settings file, will be created.

Favourite list: A direct import into the favourite lists is not possible.

General note: If there is a possible assignment, you can copy channels from each list of one window to each list of another window. For example you can transfer channels from the "Find channels" function of a SatcoDX list to a satellite of a Edision Argus Pingulux list.

In the popup menu of the channel list there are two functions that may help you to compare the channel lists of different settings files. These functions are only available in the channel list menu, if two or more SetEdit windows are opened.

With the function "Mark new channels in" you can mark in another window the channels that do not exist in your actual list. (The channel number of these channels will be marked in green.)

Info	Alt+I
Show	▶
View sorted by	▶
Change data	Return
Delete	Del
Copy	Ctrl+C
Paste	Ctrl+V
Move to	Ctrl+M
Swap channels

Mark not existing channels in	▶
Remove not existing channel markings	
Sort	▶
DISNEY CHANNEL -> Disney Channel	Alt+Y
Find channels	Ctrl+F
Find duplicates	Ctrl+D
New	Ctrl+N
✔ Split	Ctrl+T

If more than two lists are opened, you have to select in which list you want to mark the new channels. If only two windows are opened, only one possibility is given.

With the function "Mark not existing channels in" you can mark in your actual list those channels (the channel number will be marked in red) that do not exist in another window.

If more than two lists are opened, you have to select the channel list that you want to compare your actual list with. If only two windows are opened, only one possibility is given.

With "Remove not existing channel markings" or "Remove new channel markings" you can remove the corresponding markings. These functions will only appear in a channel list menu, if there are such markings in the channel list.

If you have marked the "new channels" or the "not existing channels" in a channel list, you can select them all.
Please click in the channel lists menu on select and choose the corresponding entry: "all not existing" or "all new". This entry will only be shown in the menu, if there are such markings in the channel list.

Note: For the import of channels it is useful, to choose in the configuration the value 5 or even 10 MHz for the frequency tolerance. It may happen that the frequency of the same channel differs just a little bit in different lists. If the frequency tolerance is 0, these channels will be marked as "new" or "not existing" too. But a difference of only some MHz is insignificant to the receiver, so you don't need to import these channels.

Continue with Settings from other Receivers and how to convert a settings file.

3.j Settings from other receivers and how to convert a settings file

In the following you find a description how to transfer a settings file from a receiver of the same family into your receiver or how to convert a settings file from another receiver supported by SetEdit into the format you need, so you can write it into your receiver.

Settings files from other receivers of the same familiy

If you have got two receivers of the same family (e.g. two different receiver types of the same manufacturer) and you want to transfer a settings file from one receiver into the other you may get problems because in addition to the pure channel data also the satellite and LNB configuration and some receiver identifications are included in the settings file. Many receivers only accept settings files with their own receiver identifications. That is the reason why it is not so simple to exchange settings files between two receivers even if the satellite and LNB configuration is the same.

So if you want to write a settings file from one receiver into another, you should first read once the settings from the receiver, into which you want to write the settings file.

Then please save the satellite configuration for this file: click with the right mouse button into the satellite list and select the function "save satellite configuration". Now your satellite and LNB configuration is saved on your disc.

Open with "File" -> "Open" the settings file you want to write into the receiver. Then click with the right mouse button into the satellite list and choose the function "load satellite configuration" to overwrite the satellite configuration of this file with the satellite configuration you just saved.

Finally you can write the settings file into your receiver without any problems.

Example:

You want to write a settings file from receiver A into receiver B.

1. Read with "File" -> "Read from receiver" the settings from receiver B.

2. Click with the right mouse button into the satellite list and choose the function "Save satellite configuration".

3. Load the settings file from receiver A with "File" -> "Open" in SetEdit.

4. Click with the right mouse button into the satellite list and choose the function "Load satellite configuration".

5. Write this settings file into receiver B with "File" -> "Write into receiver".

If you often take settings from the Internet but always want to keep your satellite settings, you can enable the option "When loading use personal sat settings" in the configuration menu. Then this part of the settings is always taken from your previously saved configuration.

Convert a settings file

You can convert all settings formats that are supported by SetEdit and for that you have got the corresponding editor (in form of a DLL file) into the SetEditPingulux format.

In chapter 2 is described how you can add other SetEdit editors.

Please open with "File" -> "New" an additional editor window with the format of the file you wish to convert.
Then please load with "File" -> "Open" the settings file you want to convert into another format.

You can only convert a settings file into the SetEditPingulux format, if you have already saved your satellite configuration with the function "Save satellite configuration" in the popup menu of the satellite list (see above). If you want to convert a SetEditPingulux settings file into another format, it depends on this format, if you first have to save the satellite configuration for this format or if this is not necessary (e.g. DVB2000, SatcoDX or DXAndy).

Important: If you convert a settings file only the pure channel and transponder data is taken from the source settings file. The satellite and LNB configuration are taken from the satellite configuration that has to be saved before (see above). If some channel parameters don't exist in the source settings file, a default value is taken for this parameter.

Now you can convert the loaded settings file. To do this, please click on "File" -> "Convert to" and select the format you want to convert this settings file to.

New	▶	
Open	Ctrl+O	
Last files	▶	
Clear last files list		
Read from receiver	Ctrl+R	
Save	Ctrl+S	
Save as		
Write into receiver	Ctrl+W	
Convert to	▶	DVB2000
Print	Ctrl+P	SatcoDX
Export	Ctrl+E	AZBox
Save wish list		VantageHD

Now you see the loaded settings file in the new format with the corresponding SetEdit version on your screen.

Note: The different settings formats often contain different information, so you will always loose information, when you convert a settings file. If you convert e.g. a SetEditPingulux settings file into the SatcoDX format and back, you will see that all favourite channels are gone, because the SatcoDX settings don't have favourite lists. If you convert a SatcoDX settings file into the SetEditPingulux format and back, you will recognize, that all analogue channels have disappeared. The Edision Argus Pingulux receivers only support digital channels. In the same way it may happen that certain PIDs (e.g. the text PID), volume information or the flags for "Scrambled" or "Locked" get lost.

In the configuration in the menu "Convert" you can enter the options that should be used, if you convert into this format (see chapter 5.b).
If you want to convert another settings file into the SetEditPingulux format, you can for example sort the channels by satellites or take the FAV lists from the source list. As the Edision Argus Pingulux receivers only have 32 FAV lists, only the first 32 FAV lists will be taken from the source list.
If you want to convert a SetEditPingulux settings file into another format, you have to choose these options in the configuration menu of this other format.

Continue with DXAndy settings.

3.k DXAndy settings

On the site www.dxandy.com you can download current settings for Astra, Hotbird and Turksat.

DXAndy settings are sorted by countries and you have many possibilities to adapt these settings to your own requirements.
DXAndy settings contain all channels of Astra, Hotbird and Turksat and you can automatically adapt them to the requirements of certain countries. In this case only the order but not the number of channels will change.

You can hide whole groups of channels e.g. pay tv packages you don't need, call tv channels or even all channels with one language.
You can hide channels you don't like permanently or add channels which are not included in DXAndy settings.

You can easily convert such a individually adapted settings file into your SetEdit format.

In the following we describe all functions concerning DXAndy within an example.

Let's assume the following constellation:
- Astra, Hotbird and Hispasat (not included in DXAndy settings) can be received
- A German family with Spanish members
- The favourite regional "dritte" channel is "Bayerisches Fernsehen"
- German, Spanish and English channels
- No HD receiver
- Not interested in shopping-tv channels
- Pay-TV: Premiere without sports
- Not interested in erotic channels
- The channel 9Live is not wanted

Please open with "File" -> "New" -> "DXAndy" a DXAndy editor. With "File" -> "Open" you open a DXAndy settings file.

If you click on "Config" in your DXAndy window, you notice that in the configuration the tab sheet "DXAndy" has appeared. If you click on this tab sheet you will get three more tab sheets.

<u>Sat and lists</u>:

If you click on "Sat and lists" you get the following menu:
With **Satellites** you can choose which satellites you can receive (Astra, Hotbird and/or Turksat). In the channel list you only see channels of the selected satellites.

In our example you would select Astra and Hotbird. (How to add the Hispasat channels will be described later.)

With **Lists** you can select a country specific order for your channel list. All lists contain the same channels but the order differs. In the German list ARD and ZDF are at the first positions, for Austria this would be the ORF channels, for Switzerland SF, ...

For our example you choose the list "Deutschland".

For Germany and Austria you can choose with **Special channel** which regional channel will be at the third (Germany) or second (Austria) position in your channel list.

In our example this is "Bayerisches Fernsehen".

Furthermore there are 6 options you can choose:

Hide regional "dritte" channels: In Germany it is possible than the same regional channel may have more than one regional "window" so you can find them several times in your channel list, e.g. WDR Aachen, WDR Bielefeld, WDR Köln, ... With this option you hide all channels of each regional group except one. In the example WDR Aachen stays in the channel list, the others will be hidden.

Hide HDTV channels: All HDTV channels are hidden.

Hide Shopping-TV channels: All Shopping-TV channels are hidden.

Hide Call-TV channels: All Call-TV channels are hidden.

Insert dummy channel with list name: DXAndy files are originally sorted by FAV lists. If you convert this settings file and this option is activated a dummy channel will be inserted at the beginning of each channel group (FAV list) with the name of this favourite list. For this function you have to disable in the configuration of the destination format the option "Sort channel list by satellites".

Add personal FAV list: With this function you can automatically add a FAV list you have created with another SetEdit editor and saved to your hard disc with the function "Export" of the favourite lists menu of this editor. With the button "..." you can choose this FAV list. Now this FAV list will be added automatically each time you load a new DXAndy file.

Note: In chapter 3.d you can read how to create such a "personal FAV list".

In our example you activate the options "Hide HDTV channels" and "Hide Shopping-TV channels". Furthermore you choose the option "Add personal FAV list". With the button "..." you select the favourite list with the Hispasat channels you have created with another Editor before.

Pay TV:

With "Pay TV" you get the following menu:
Crypt systems: Here you can choose the crypt systems you can receive. The channels of the other crypt systems will be hidden. With "Only FTA" all scrambled channels are hidden, only the "Free-To-Air" channels stay in the channel list.

In our example you choose "Nagra" for the Premiere package.

You can hide these lists: With this function you can hide several channel groups, e.g. all Premiere channels or all erotic channels. In this list you see all channel groups which either contain FTA channels or are scrambled with one of the systems you have selected above.

In our example you choose "Erotic" to hide the erotic channels and then ORF, Digital+, ... to hide the packages which are scrambled with Nagra too but for which you have no subscription.

Language:

If you click on "Language" you get the following menu:
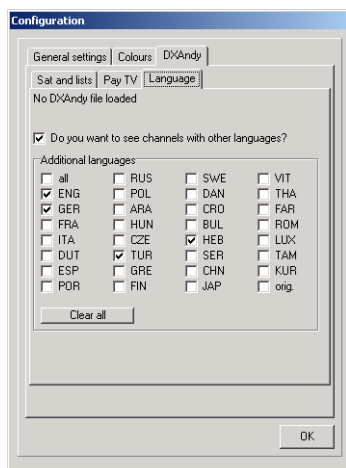

At the upper side of this menu you see for which language this file has been optimised, i.e. which national list you have selected on the tab sheet "Sat and lists".
In our example this is German (GER).

Now you can choose if you would like to have channels with other languages in your channel list or not. If not you will only have channels of the language group your list has been optimised for in your channel list (In the example this is German).

If you activate this option, a box with "Additional languages" appears below. Here you can choose the languages like to see channels with (channels with other languages will be hidden). With "Clear" all language markers disappear, with "all" all languages are selected.

In our example you want to see (additional to the German channels) English and Spanish channels too, i.e. you have to select "ENG" and "ESP".

If you click on "OK", your channel list will be actualised.

In our example you will see in the channel list all German FTA channels of Astra and Hotbird with ARD, ZDF and Bayerisches Fernsehen at the first positions, the complete Premiere package and all English and Spanish FTA channels. Erotic, Shopping-TV and HDTV channels are hidden. At the end of the channel list you see the Hispasat channels you added.

Now you can hide certain channels or add certain channels or even add a complete channel group.

Hide channels:
If you mark a channel as "deleted" it will get the following symbol in the channel list: 🗑 .
If you convert a DXAndy file into another format, all channels with this symbol will be removed from the channel list.
Your SetEditDXAndy editor automatically saves, which channels you have marked as "deleted". I.e. you only have to make this selection one time but can always download the current settings, convert them and write them into your receiver.

In our example we want to hide the channel 9Live and the Premiere sport channels. Select these channels in the channel list, click with the right mouse button in the channel list and select the function "Mark as" -> "deleted".

Add channels/channel groups:
After you have converted the settings file you can add favourite lists you have saved to your hard disc before with the "Import" function of the FAV-List menu (chapter 3.d) or you can choose in the DXAndy configuration on the tab sheet "Sat and lists" a FAV list that will always be added (see above).

The channel list of a DXAndy file may contain gaps. I.e. empty channels have been added to make sure that the position of first channel of each channel group has a round number.
With the function "Compact channel list" of the channel list menu you can remove these empty channels.

Continue with Wish lists.

3.l Wish lists

With SetEdit you have the possibility to create a personal channel list, save this list as wish list and then (if you have got the corresponding SetEdit full version) adapt any settings file to this wish list and write it into your receiver.

This means the order of the channels will be taken from the wish list, unwanted channels and transponders will be deleted and new channels can easily be added.

You can make a new channel research with your receiver whenever you want, read these settings from your receiver and adapt them to your wish list. So you can be sure not to miss any new channels, but you don't each time need to rearrange the channels, delete the same channels you don't want to see or add channels (which e.g. haven't been found by the receiver because they were not active at the time you made the channel research).

Create a wish list:

Please load any settings file in SetEdit (for example a settings file you just read from your receiver).

Now you start with moving the most important channels you know on the positions you want (for example ARD on position 1, ZDF on position 2, ...).

Then you can mark channels you don't want to watch as "unwanted".

It's important to mark those channels as unwanted and not to delete them, because the wish list will be used to delete these channels automatically from every new settings file. If you delete a channel, this channel will appear again in your settings each time you make a new channel research with your receiver.

The unwanted channels will stay in your settings file but will be shown with light grey font colour and marked with a red minus symbol. So if you change you mind about a channel, you simply have to remove the marking.
If you save a settings file or write it into the receiver, all unwanted channels or transponders are deleted.

To mark one or more channels as unwanted there are three possibilities:
You can open the channel data window (double click on the channel) and click on "unwanted" there.
You can use the "mark as" function from the channel list menu or the shortcut "Strg-Alt-K" to mark one or more selected channels as unwanted.

If you go through the channel list and realise that a transponder only contains channels you don't want to watch, you have the possibility to mark the whole transponder and all its channels as "unwanted".

Note: If you mark a transponder as unwanted and than adapt a settings file so this wish list, all channels of this transponder will automatically be marked as unwanted, even if they were new!

To do this you can double click on the transponder and then click on unwanted in the transponder data window. But if you want to continue editing the channel list you have to click on "All" in the satellite list and then scroll to the position in the channel list where you want to continue. So it's much easier to select a channel of the transponder you want to mark as unwanted and then use the function "mark as" -> "TP of this channel unwanted" of the channel list menu or use the shortcut "Strg-Alt-T".

You can mark channels which you always want to keep in your settings but which may not always be found by the receiver (for example because they are not active all the time) as "extra" channels. These channels will always be added when you adapt a settings file to your wish list.

You also have the possibility to link a channel with one or more alternative channels. To do this select these channels and select the function "mark as" -> "linked" of the channel list menu. This means

when you adapt a settings file to this wish list and the first of the linked channels is not found, this channel will be replaced by the next channel which is linked to it.

It is possible to link more then two channels. If you adapt a settings file to this wish list the first of the linked channels that is found will be moved to the corresponding position in the channel list.

Example:
You have got a HD receiver and a "not HD" (SD) receiver. In your wish list you move the channel arteHD on position 9 and mark the normal arte channel as unwanted. Then you link those two channels.
So if you adapt a settings file from your HD receiver to this wish list and write it into this receiver, you will find the channel arteHD on position 9 and arte (SD) will be deleted because it is marked as unwanted.
If you adapt a settings file of the "not HD" receiver to this wish list and write it into this receiver, the channel arteHD will not be found and so the alternative channel arte (SD) will be moved to position 9, even though it had been marked as unwanted before.
So you only need to create one wish list, which you can use for both receivers.

With "mark as" -> "not linked" you can delete such a link.

Save a wish list:

If you have created your personal wish list you should save it.

Please click on the button "File" and choose the function "Save wish list". You get a window, where you can enter a name for your wish list and choose where you want to save it. All wish lists get the extension ".wish".

All channels, transponders and satellites are saved even if they are not wanted, extra or not found.

You have the possibility to save more than one wish list. This may be interesting if you have got more than one receiver and if those receivers are used from different persons with different preferences.

Adapt a settings file to a wish list:

If you have saved a wish list you can now adapt any settings file (if you have got the corresponding SetEdit full version) to this wish list and then write it into the receiver.

For example you make a channel research on the corresponding satellites with your receiver than you read this settings file from your receiver and open it with SetEdit.

Now please click on the button "File" and choose the function "Adapt settings to a wish list". You get a window where you can choose the wish list you want to adapt your settings to and click on "OK".

Now each channel of the wish list will be searched in the settings file.
Channels which are found appear in the channel list on the corresponding position. If a channel is not found it also appears in the channel list but with a light grey font colour and marked with a red X. Extra channels will always be added, if they are found or not. The unwanted channels are moved to the end of the channel list, appear with light grey font colour and are marked with a minus symbol. Channels which only appear in your settings file and which haven't been in the wish list before, will be marked with an "N" as new channels. New channels also appear at the end of the channel list but before the unwanted channels.

Note: If a new channel is found on a transponder which is marked as unwanted, this channel will automatically be marked as "unwanted" and not as "new"!

Administer wish settings:

Now you can for example edit the "new" or "not found" channels.

With the shortcut "STRG-Alt-N" you get from your actual position in the channel list to the position of the next "not found" or "new" channel.
With the shortcut "STRG-Alt-P" you move the actual selected channel to the first position of the new channels. Then the next channel in the channel list will be selected.
With the shortcut "STRG-Alt-K" you can mark the actual selected channel as "unwanted", the next channel in the channel list will be selected automatically.
With the shortcut "STRG-Alt-T" you can mark the transponder of the actual selected channel and all other channels of this transponder as "unwanted".

Note: If you mark a transponder as unwanted and than adapt a settings file so this wish list, all channels of this transponder will automatically be marked as unwanted, even if they were new!

If a channel is not found because it doesn't exist anymore or the frequency has changed, you can of course delete this channel or replace it by the corresponding new channel (if the frequency has changed).

If a channel is not found because of other reasons - for example because it isn't active all the time and so it hasn't been found with the channel research of the receiver - you can either mark it as "Extra" or you don't change it at all. If you save this file with "Save wish list" these channels will be saved too, but without the marker for "not found". The markers for new channels will disappear too.

But if you save the settings file or write it into the receiver all "not found" or "unwanted" channels will be deleted. All markers concerning the wish list functions will disappear too.

Write wish settings into the receiver:

If you have adapted a settings file to your wish list and if you have edited new or not found channels (if there are any of them in your adapted settings file), you can finally write this settings file into your receiver.

Please click on the button "File" and choose the function "Write into receiver".
You get a message. Please follow the instructions in this message to transfer the settings into your receiver.

All "unwanted" channels and transponders and all "not found" channels which are not marked as "Extra" channels will be deleted.

4 Program use and personal configuration

SetEditPingulux is mostly used with the mouse. You can also reach many functions with keyboard shortcuts.
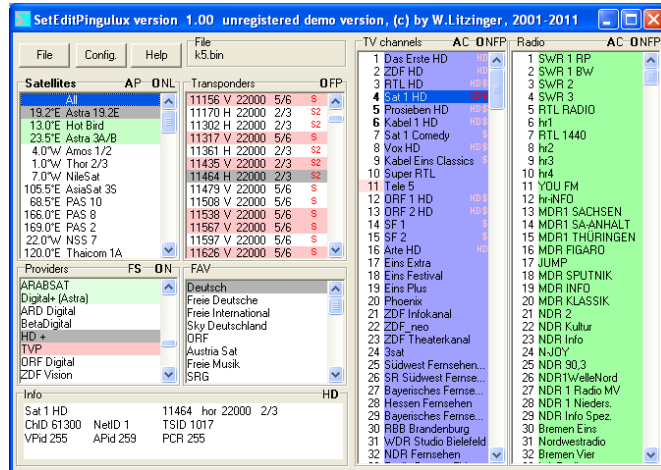

On the main window you will find a group of buttons for the general functions ("File", "Config." and "Help") and the lists that contain the transponders, satellites, providers, favourite lists (FAV) and the channels. If you hit the right mouse button in the satellite, provider, transponder or one of the channel lists you will get a popup menu with the specific functions for this list.

With "Help" you can open the help file, get some information about you SetEdit editor, open your SetEdit directory or look for updates of SetEdit.
In some frames you find uppercase letters. If you click on these letters you can change some viewing modes.

You can close every window that comes in SetEditPingulux (except the main window) with the Esc-key on your keyboard.

In some lists you may find the following red symbols. These symbols indicate:

$	Scrambled channels
?	Locked channels
×	Skipped channels
HD	HD channels
S	DVB-S transponders (satellite)
S2	DVB-S2 transponders (HD)
−	Unwanted channels (Wish lists)
+	Extra channels (Wish lists)
✗	Not found channels (Wish lists)
N	New channels (Wish lists)

If a channel or transponder name is marked red there is a duplicate of this channel or transponder in the settings.

Transponders and providers marked in red are empty; they contain no channels.

TV channels appear in light blue, radio channels in light green.

Providers that only contain either TV channels or Radio channels are marked with these colours too.

If a channel or transponder is shown with light grey font colour, it's an unwanted or not found channel or transponder (see chapter 3.l).

Channels that are in a FAV list are marked in the channel list with a darker background colour.

If the channel number is marked with a red background colour, the channel is assigned to a vertical polarised transponder. If the channel number has a white background colour, the channel is assigned to a horizontal polarised transponder.

If a satellite has a green background colour, it is activated, which means there are already channels on this satellite.

When you select a channel, the transponder, the satellite, the provider and the favourite list (if the channel is in a favourite list) are marked with a different colour.

You can change all colours in the configuration menu.

In the lower left corner you will find an "Information" section, where you see the parameters of a selected transponder or channel.

When you select a satellite in the satellite list only the transponders and channels that are in that satellite are shown. When you click in a transponder, provider or favourite list only the channels that are in this list are shown.

You can adapt the design of SetEditPingulux to your personal wishes.

To change the size of the main window you can either click on the maximise button in the upper right corner or drag one of the margins of the window.

If the main window is large enough, the channel lists can be shown in more than one column. Then you have more channels in view. You can change the width of these columns in the configuration menu on the tab sheet "General settings". In the section "Column width" you can enter if a new column is created, when 100% (auto) or 90-30% of the channels are shown completely. The other channel names are cut.
With "manual" you can enter the column width by hand. Select the function "Setup column width" from the menu of the channel lists and then you can click on the position where you want to have the right border of the first column.

Note: There is a minimum width for the columns. If the window is too small to show more than one column the column width has no effect.

In the section "Cut names" you can enter if the channel name is cut at the end,

or if a part of the channel name is cut from the middle.
In the configuration on the tab sheet "General settings" you can change the menu language of SetEdit (this concerns all opened SetEdit windows) and specify whether the PIDs are shown in decimal or hexadecimal form (see chapter 8).

If you activate on the same tab sheet the option "Show channel count in lists" the number of channels of each satellite, transponder, provider and each FAV list is shown behind the name of this list.

Especially when you want to move channels from the beginning to the end of your list, it may be useful to use the split function. With this function you can split your list into two parts, one showing the beginning and the other showing the end of your settings (see chapter 3.b.)

With a double-click on the frame "TV channels" or "Radio channels" only the choosen channel list is shown. With another double-click on this frame both lists are shown again. With the "show" function of the menu of the channel list you have also the possibility to choose, if you only want to see the TV, the radio channels, or both channel types.

You can also change the viewing mode of the PIDs, if you click on the letters "H" for hexadecimal or "D" for decimal in the frame of the "Information" section.

For some functions you also have shortcuts for keyboard using:
Ctrl-O: Open a settings file
Ctrl-S: Save settings
Ctrl-R: Read settings from the receiver
Ctrl-W: Write settings into the receiver
Ctrl-P: Print settings
Ctrl-E: Export settings
Alt-R: Show only radio channels
Alt-T: Show only TV channels
Alt-A: Show TV and radio channels
Ctrl-0 (zero): Load the last used file
F1: Help
F2: Satellite list
F3: Label list
F4: Transponder list
F5: Provider list
F6: FAV list
F7: TV list
F8: Radio list
F10: Configuration
F11: Toggle between "Show only channels" and " Show all information"

Depending on the editor you are using, some lists are not available, for example the DVB2000 has no satellite list.

To close a SetEdit window please click on the "close" button:

or select "Close" from the "File" menu. If only one editor window is opened you close the complete program.

If you select "Exit" from the "File" menu all open editor windows are closed. In the configuration you can enter with "Restore last session when starting" that all opened editor windows are restored when you start the program the next time.
When you like to use this function you have to finish from SetEdit with the "File" -> "Exit" function. If you close all windows one by one only the last opened window will be restored.

Note: If you have unsaved changes you are asked if you want to exit or first save these changes.

5 Functions

5.a File functions

To get the file functions, please click on the "File" button. You will get the following popup menu:

New	▸
Open	Ctrl+O
Last files	▸
Clear last files list	
Read from receiver	Ctrl+R
Save	Ctrl+S
Save as	
Write into receiver	Ctrl+W
Convert to	▸
Print	Ctrl+P
Export	Ctrl+E
Save wish list	
Adapt settings to a wish list	
Close	
Exit	

With **New** you can open another window of SetEdit with the same or another format, e.g. for the import of channels or if you want to compare different channel lists (see chapter 3.i.)

With **Open** you can load settings from your disc.

With **Last files** you get a list of the 10 last used files, which you can load.

With **Clear last files list** you can remove all entries from the last files list.

With **Read from receiver** you can read the settings from your receiver into SetEditPingulux. You get a message on your screen. When you have followed the instructions in the message, the settings are read from the receiver and shown in SetEditPingulux.

With **Save** or **Save as** you can save the current settings to your disc.

With **Write into receiver** you can transfer the settings from SetEditPingulux to your receiver. You also get a message. When you have clicked on "OK", the settings are written into the receiver.

With **Convert to** you can convert your actual loaded settings file into another settings format (e.g. SatcoDX). If you want to convert another settings format (e.g. SatcoDX) into the SetEditPingulux format you first have to open a new editor window (with File -> New) with the corresponding SetEdit format (e.g. SatcoDX) and then you can load the Settings file you want to convert in this editor window. To do this you first have to save your satellite configuration (see chapter 3.j).

With **Print** you can print your settings (see chapter 3.g).

With **Export** you can export your settings as an ASCII file (e.g. to open it with Word). You have the same options as with the print function.

With **Save wish list** you can save the actually loaded settings file as a wish list (see chapter 3.l).

With **Adapt settings to a wish list** you can adapt an actually loaded settings file to a previously saved wish list (see chapter 3.l).

With **Close** you close the actual active SetEdit window. If only one window is opened you close the complete program.

With **Exit** you exit from SetEdit. All open editor windows are closed. In the configuration you can enter with **Restore last session when starting** that all opened editor windows are reopened when you start the program the next time.
When you like to use this function you have to finish from SetEdit with the "File" -> "Exit" function. If you close all windows one by one only the last opened window will be restored.

5.b Configuration

Click on the "Config." button to change the general settings of SetEdit. There are four tab sheets in the configuration menu.

General settings:

If you click on "General settings" you get the following menu:
The value **Frequ. Tol.** (Frequency tolerance) is used when importing and indicates the tolerance a transponder frequency may have relative to the imported one to be considered to be the same. If you have for example a transponder with the frequency 11721 MHz in you settings and you import a channel with the frequency 11720 MHz and the frequency tolerance is set to 5 MHz no new transponder is created. This tolerance is also used for the transponder list.

With **Column width** you can select if 100% (auto) or 90-30% of all channels have to fit completely to a column. All other channel names are truncated. With "manual" you can enter the column width by hand. Please select the function "Setup column width" from the menu of the channel lists and then you can click on the position where you want to have the right border of the first column.

Note: There is a minimum width for the columns. If the window is too small to show more than one column the column width has no effect.

In the field **Cut names** you can enter, if channel names that are too long (see column width), are cut at the end or in the middle.

In the field **PIDs** you select how the PIDs are shown/entered (decimal or hexadecimal). You can also switch between these two viewing modes, if you click on the "H" for hexadecimal or the "D" for decimal in the frame of the "Information" section.

With **Language** you can select the menu language you would like. This language is taken for all opened SetEdit windows.

With **Always on top** SetEditPingulux always stays on top of your desktop.

With **Start with last used file** SetEditPingulux opens automatically the last used file every time you start the program.

With **When loading use personal sat settings** you can, after you have once saved your satellite configuration (see chapter 3.j), use this configuration automatically when loading settings. For example you can use your satellite settings always when you load settings from other sources.

If **Restore last session when starting** is activated, all editor windows that were opened when you closed the last session are reopened (see chapter 5.a.)

If you activate **Show channel count in lists** the number of channels of each satellite, transponder, provider and each favourite list is shown behind the name of these lists.

<u>Colours</u>:

If you click on the tab sheet "Colours", you will get the following menu:
Here you can change the colours that are used to mark the following states:

Activated (programmed) **satellites**

Horizontal polarised transponders, **vertical** polarised transponders

TV channels and **radio channels**

TV or **radio channels** that are in a **favourite list**

Transponder, satellite, provider and FAV list(s) of an actually selected channel (**Active Tr/Sat/Pr/FAV**)

Channel duplicates

Empty transponders and **providers**

New or **not existing channels** (for the import function, see chapter 3.i)

The **icons** for e.g. "locked", "skipped", "scrambled", "HD" or for the different transponder types.

With a double click on the frame of a colour field, you get the default colour again.
Network:

On the tab sheet "network" you can enter the network configuration. You will get the following menu:
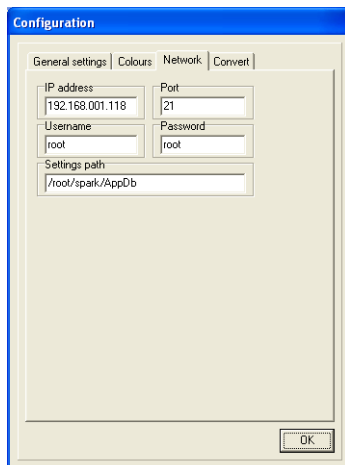

Here you have to enter in the field **IP address** the IP address of you receiver (you find the IP address in the receiver with Menu -> System -> Network). Usually **port** 21 is used for the FTP connection, please change this value only if you really know that another port is used. The **Username** is usually "root" and the **Password** for this user is "root" (if you did not change it). The **path**, where the settings are found, is "/root/spark/AppDb".

Convert:

On the tab sheet "Convert" you can choose which options should be used, if you convert another settings file into the SetEditPingulux format.

Sort channel list by satellites: The channels of the source list will be sorted by satellites, when you convert into the Edision Argus Pingulux format.

Convert labels to FAV lists: The first 32 labels of the source list will be converted to FAV lists.

Convert providers to FAV lists: The first 32 providers of the source list will be converted to FAV lists.

Convert FAV lists to satellites: All FAV lists of the source list will be converted to satellites.
Note: If you want to use this function it is important that each FAV list of the source list only contains channels of one satellite.
To make a satellite empty there is the function "clear" in the satellite menu (see chapter 5.e.)

This option may be useful for example if the source list has more FAV lists as you can have in your SetEditPingulux settings and you want to keep all of them.

Take FAV list(s) from source list: The first 32 FAV lists are taken from the source list (the Edision Argus Pingulux receivers only have 32 FAV lists).

If you want to convert a SetEditPingulux settings file into another format, you have to choose these options in the configuration menu of this other format. Depending on the receiver there can be up to 10 different options.

5.c Channel functions

Please select the channels you like to edit/modify.

You get most functions when you click with the right mouse button on a channel list. You will get the popup menu of the channel list:

Info	Alt+I
Show	▶
View sorted by	▶
Change data	Return
Delete	Del
Copy	Ctrl+C
Paste	Ctrl+V
Move to	Ctrl+M
Swap channels	
Select	▶
Invert selection	Ctrl+I
Mark as	▶
Mark new channels in	▶
Remove new channel markings	
Mark not existing channels in	▶
Remove not existing channel markings	
Sort	▶
DISNEY CHANNEL -> Disney Channel	Alt+Y
Find channels	Ctrl+F
Find duplicates	Ctrl+D
New	Ctrl+N
✔ Split	Ctrl+T

Some menu items are only visible, when you are using the import functions.

Info: Here you get the number of TV and radio channels, transponders, satellites and providers that are in your settings.

With **Show** you can change the viewing mode of SetEditPingulux. You can select if you **only** want to see the **TV** or the **radio** channels or **both**.

Note: Alternatively you can double-click on the TV/Radio frame to change the viewing mode.

Furthermore you can hide the satellites, transponders, providers, favourite lists and the data window with **Show only channels**. With **All lists** you can see all lists again.

With **View sorted by** the channel list can be shown in the **original** order, sorted **alphabetically** or sorted by **frequencies** or **polarities**.

With **Change channel data** you get the following window where you can change the properties of a channel:
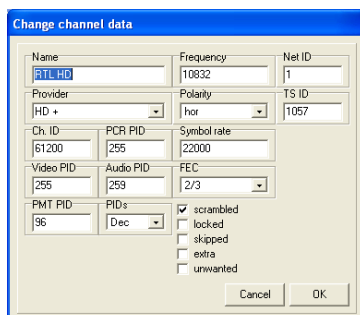

In the field **Name** you can change the name of the channel.

You can enter the **PIDs**, the **Channel ID** (Service ID), the **Service Type** (TV, radio or HDTV channel) and the **transponder data** of the channel and enter, if the channel is **locked** (you have to enter the parental PIN), **scrambled** or marked as **skipped**.
With **PIDs** you can choose if the PIDs are shown decimal or hexadecimal.
With **Provider** you can change the provider of the channel.

Note: The transponder type or the pilot value (only for DVB-S2 transponders) can't be changed in this menu. Please double-click on a transponder and change these values in the window that appears.

Note: For some transponder types certain channel data boxes will disappear, e.g. DVB-C and DVB-T transponders have no polarity.

You can find a longer description of the different PIDs, IDs and transponder data in chapter 3.h.

With **Delete** you can delete selected channels or, when you are in a FAV list, remove them from this favourite list.
You can also delete one or more selected channels by hitting the Del key on your keyboard.

With **Copy** you can copy a channel, then you can paste the channel to another position.

With **Paste** you can paste a channel that was previously deleted or copied.

With **Move to** you can move a channel to a position that you enter with the keyboard.

With **Swap channels** you can swap two selected channel. You can only select this function when there are exactly two channels selected in the channel list.

With **Select** you can select **all**, **all scrambled**, **all locked**, **all skipped**, **all HD channels**, **all C-band channels**, **all Extra channels**, **all unwanted channels** or (for the import) **all new** or **all not existing** channels (depending on which channels are actually marked).
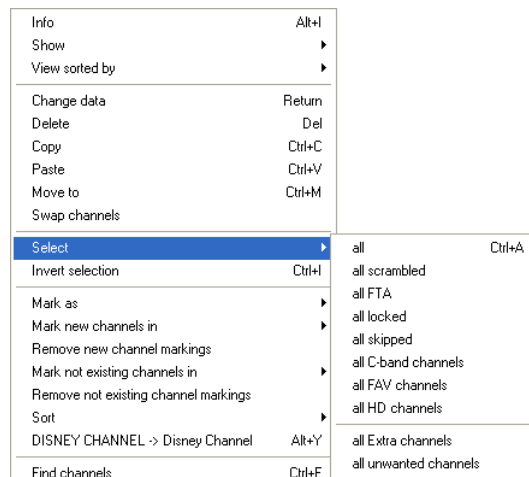

With **Invert selection** you can invert the selection, the channels that are selected will become unselected and vice versa. If you like to delete all but one channel from a transponder, you can select the channel you like to keep, invert your selection and delete the now selected channels.

With **Mark as** you can change the following properties for one or more selected channels at once:
-Mark channel(s) as "(un)locked", "(not) skipped" or "(un)scrambled"
-Assign channel(s) to a service type
-Assign channel(s) to a FAV list or remove it/them from all FAV lists
-Remove channel(s) from their providers (provider "---")
-Mark channel(s) as "(not) linked", "(not) unwanted" or "(not) extra" (wish lists)
-Mark the transponders or the selected channels with all their channels as unwanted (wish lists)

|			
Info	Alt+I		
Show	▶

		not extra	SRG
		unwanted	Ctrl+Alt+K	HD plus
		not unwanted	Shift+Alt+K	Nova
		TP of this channel unwanted	Ctrl+Alt+T	
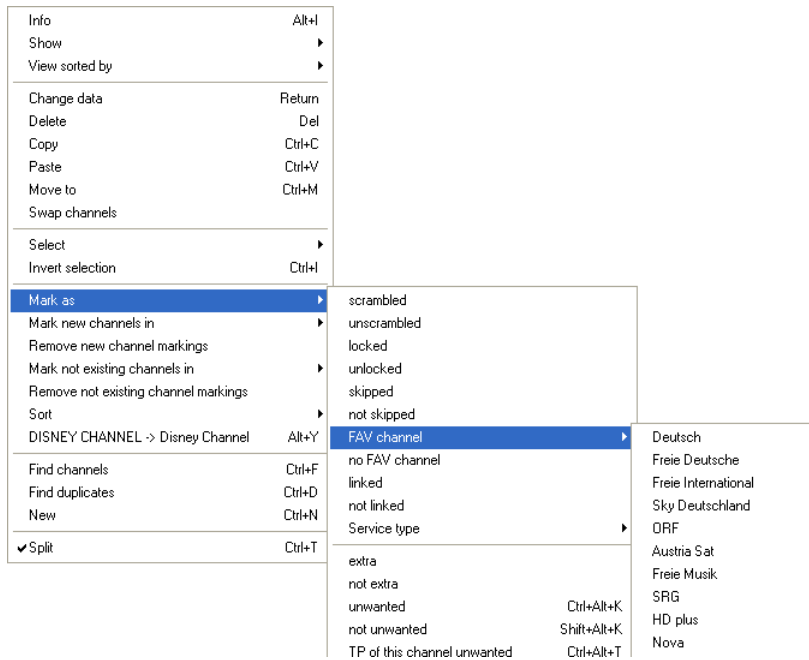

Mark new channels in: If you have opened more than one window of SetEdit (Import), you can mark in another channel list the channels that you don't have in your actual channel list.

Mark not existing channels in: If you have opened more than one window of SetEdit (Import), you can mark in your actual channel list the channels that you don't have in another channel list.

Remove new/not existing channel markings: With this function you can remove the markings for new or not existing channels in your actual list (Import).

With **Sort** you can sort selected channels by **alphabet**, by **frequency** or by **polarity** or sort the entire channel list by **providers** or **satellites**.

Info	Alt+I	
Show	▶	
View sorted by	▶	
Change data	Return	
Delete	Del	
Copy	Ctrl+C	
Paste	Ctrl+V	
Move to	Ctrl+M	
Swap channels		
Select	▶	
Invert selection	Ctrl+I	
Mark as	▶	
Mark new channels in	▶	
Remove new channel markings		
Mark not existing channels in	▶	
Remove not existing channel markings		
Sort	▶	Sort by alphabet
DISNEY CHANNEL -> Disney Channel	Alt+Y	Sort by frequency
		Sort by Service ID
Find channels	Ctrl+F	Sort by polarity
Find duplicates	Ctrl+D	Sort channel list by Satellites
New	Ctrl+N	Sort channel list by providers

With **DISNEY CHANNEL -> Disney Channel** you can change the names of the selected channels from upper case to lower case. Uppercase letters are usually wider than lower case letters, so this allows you to see more characters of the name in the channel list of the receiver. Only words with more than 3 characters are converted. If there are both upper and lower case letters in the channel name the word is not converted (e.g. EuroSport stays as it is). In the configuration file of SetEditPingulux (SetEdit.ini) there is a list of up to 10 words that are converted although they are shorter than 4 letters (CO, INT, FOX) and a list of words that are not converted although they are longer than 3 letters (CNBC, ESPN).

With **Find channels** you can find channels by name.

With **Find duplicates** you can look for channel duplicates.

With **New** you can create a new channel. For HDTV channels you have to adapt the transponder type and the pilot value in the transponder data window.

With the **Split** function you can tile the TV and radio list in two parts. It is the same list but from two points of view. Changes in one list also affect of course the second list. You can move a channel from the upper to the lower list of course.

The function **Setup column width** is only visible in this menu, when you have entered "manual" in the section "Column width" in the configuration menu (see chapter 5.b). With this function you can enter the column width by hand. Please select this function and then you can click on the position where you want to have the right border of the first column.

Note: There is a minimum width for the columns. If the window is too small to show more than one column the column width has no effect.

To **move** channels you simply drag them with the mouse to the position where you want them to be (if you reach the border of a list the list will scroll automatically).

To **assign** one or more channels to a **satellite**, **transponder**, **provider** or a **favourite list** drag it/them with the mouse to the name of the satellite, transponder, provider or favourite list.

To see all channels of a satellite, provider, transponder or a favourite list, please click in the respective list on the corresponding entry.

In the frame of the channel list there are several uppercase letters for the following functions:

A: The channels and the satellites, providers, transponders, FAV lists and the data window are shown.
C: Only the channels are shown.
O: The channels are shown in original order.
N: The channels are shown in alphabetical order.
F: The channels are shown sorted by frequencies.
**P**: The channels are shown sorted by polarities.

5.d Provider functions

First you have to select the provider you want to modify. You will see all channels that belong to this provider.

To assign one or more channels to this provider please select the channels and drag them with the mouse to the provider name.

You can also change the provider of a channel in the channel data menu, (see chapter 3.e).

You get most functions if you click with the right mouse button on the provider list. You will get the popup menu of the provider list.
Change name: Here you can change the name of a provider. You also get this by double-clicking on the provider or by hitting the Enter key.

View sorted by: The providers can be shown in **original** order or sorted **alphabetically**.

New: Here you can create a new provider. You get the same window as in the "change name" function.

Delete: Here you can delete a provider and all channels that belong to this provider.

Delete all empty providers: Here you can delete all providers that don't contain channels.

With **Remove provider** you can delete a provider from the provider list, without deleting the channels too. The channels, which used this provider, will stay in the channel list, but they don't belong to any provider anymore. They are assigned to the provider "---". This provider does not appear in the provider list of the receiver.

It is not possible to change the order of the channels within a provider list independently of the main channel list.

To change the **order** of the providers within the provider list please use the drag & drop function or hit the ctrl key, keep it pressed and use the arrow keys (or Home or End) to move the selected provider.

If a provider only contains radio channels, it is shown in the provider list with a green background. Providers with only TV channels have a blue background colour. If a provider contains both channel types, it is shown with a white background. Empty providers are marked with a red background colour.

In the frame of the provider list there are several uppercase letters for the following functions:

F: The provider list is fixed. That means it does not jump to the provider of the selected channel.
**S**: The provider list scrolls to the provider of a selected channel.
O: The provider list is shown in original order.
N: The provider list is shown in alphabetical order.

5.e Satellite functions

When you click on a satellite only the channels and transponders of this satellite are shown.

When you click with the right mouse button in the satellite window you will get the following popup menu:
Show active satellites/Show all satellites:
With this function you can select if you want to see all satellites in the satellite list or only the active satellites (satellites which already have channels).

Change data:
You will get the following window in which you can change the satellite-specific data:
You can also double-click on the satellite to get this.

Here you can change the **Name, the geographical position (longitude**), the **LNB configuration**, and the parameters for the **DiSEqC**, **12 V**, **14/18 V** and **0/22 kHz** of this satellite.
With **LNB** you can assign the satellite to an LNB type.

View sorted by:
With this function you can select if the satellites are shown in **original** order, or sorted **alphabetically** or by the geographical position (**longitude**).

Sort:
With this function you can sort the whole satellite list **alphabetically** or by their **Longitudes**.

Hotbird -> 13.0E Hotbird:
This function adds the geographical position at the beginning of the name of each satellite.

With **Clear** you can clear a satellite. All channels and transponders are deleted and the geographic position is set to 0.0° east. This is useful if you want to use the convert option "Convert FAV lists to satellites" (see chapter 5.b).

With **New** you can enter a new satellite.

With **Delete** you can delete a satellite and all transponders and channels that used this satellite.

Save satellite configuration:
With this function you save the satellite and LNB configuration of the actual loaded settings file (see chapter 3.j.)

Load satellite configuration:
With this function you can overwrite the satellite and LNB configuration of the actual settings with a configuration you saved before. In the configuration menu you can enter that this is done automatically when you load a file.

In the frame of the satellite list there are several uppercase letters for the following functions:

A: Show all satellites
P: Show only active (programmed) satellites
O: Show satellites in original order
N: Show satellites sorted by alphabet (names)
L: Show satellites sorted by their geographical position (longitude)

5.f Transponder functions

If you select a transponder only the channels that belong to this transponder are shown.

If you select "All" in the satellite list you can move the mouse over a transponder to see the satellite of this transponder.

You get most functions if you click with the right mouse button on the transponder list. You will get the popup menu of the transponder list.
With **View sorted by** you can select if the transponders are displayed in their **original** order or sorted by **frequency** or **polarity**. The transponders will remain in the original order internally.

With **Sort** you can sort the transponder list by **frequencies** or **polarities**. With this function you also change the internal order off the transponders.

With **Change data** you can change the parameters of a selected transponder. You get the following window:
You can also call this function with a double-click on a transponder. Here you can change the **frequency**, the **polarity**, the **symbol rate**, the **FEC**, the **Net ID** and the **TS ID** of a transponder.

In the box **Type** you can change the transponder type and with **Pilot** the pilot value (only for DVB-S2 transponders).

If you mark a transponder as unwanted, the transponder and all its channels will be shown with light grey font in the corresponding list and will be marked with a red minus.

Caution: If you save a settings file, all unwanted channels and transponders are deleted.

You need these markings for the wish lists functions (see chapter 3.l).

These changes are made for all channels that use this transponder too.

With **Delete** you can delete a transponder and all its channels. You can also use the Del key on your keyboard. If the transponder has channels, you are asked if you really want to delete these channels. If you want to delete a transponder without checking if existing channels are deleted too, you can use the shortcut Ctrl-Del.

With **Delete all empty transponders** you can delete all transponders that don't contain channels.

With **New** you can create a new **transponder** or a **new TV** or **Radio channel on the selected transponder**.

If you want to create a new transponder, and a satellite is selected in the satellite list, the transponder is assigned to this satellite. If "All" is selected in the satellite list and a transponder is selected in the transponder list, the new transponder is assigned to the satellite of this selected transponder. If "All" is selected in the satellite list and no transponder is selected, you can't create a new transponder.

The red letters and numbers specify the transponder type: S for DVB-S, S2 for DVB-S2, S28 for DVB-S2 in 8-PSK, S2Q for DVB-S2 in QPSK, C for DVB-C (cabel) and T for DVB-T (terrestrial).

If you select a transponder a little dot appears in front of this transponder and of all transponders with the same satellite.

Transponder marked in red are empty; they contain no channels.

If a transponder name is marked red there is a duplicate of this transponder in the settings.

In the frame of the transponder list there are several uppercase letters for the following functions:

O: The transponders are shown in original order.
F: The transponders are shown sorted by frequencies.
P: The transponders are shown sorted by polarities.

5.g Favourites

The Edision Argus Pingulux receivers have 32 favourite lists into which you can copy your favourite channels.

When you click with the right mouse button in the favourite list, you get the following menu:
With **Export** you can save a selected FAV list.

With **Import** you can load a previously saved FAV list.

Each channel can be in more than one FAV list without creating a duplicate first.

Channels that are in a FAV list are marked in the channel list with a darker background colour.
(You can change these colours in the configuration.)

Add/remove a channel to/from a FAV list:
To add one or more channels to a FAV list, please select the channel(s) you want to add to a FAV list. Now you can drag them to the FAV list (drop them on the name of this list). They are added at the end of this FAV list.
To remove a channel from a FAV list, please select the FAV list and then the channel that you want to remove from the favourite list and use the delete function of the channel list menu or hit the Del key on your keyboard. If you delete a channel within a FAV list, this channel is only removed from this FAV list and not from the main list.
It is also possible to assign one or more channel(s) to a FAV list or remove them from all FAV lists with the help of the "Mark as" function in the channel list menu.

Change channel order within a FAV list:
To change the order of the favourite channels, please select the channel(s) you wish to move. Now you can drag them to the position within the FAV list where you want to have them (drop them on the new position).

Within the favourites you can change the order independently of the order in the main list. If you now change the order by using the drag & drop function you will only change the order within this FAV list but not the order of the main list. In the opposite way the order of the channels in a FAV list will not change, if you change the order of the channels in the main list.

To change the name of a FAV list please make a double click on the FAV name, you will get the following window:

Here you can enter the name of the FAV list.

Note: It is not possible to change the names of the FAV lists; they are hard coded in the receiver.

You can easily change the order of the FAV-lists by drag & drop.

Continue with FAQ.

6. FAQ

What do I need to transfer the settings from the receiver to the PC and back?

You need a network cable.

I have got problems with the network connection. What should I do?

Please check if you have entered the correct network data in the configuration.

Why is it not possible to convert into the SetEditPingulux format?

It is only possible to convert another settings file into the SetEditPingulux format, if you have saved the satellite configuration before (see chapter 3.j).

I have got two receivers of the same family, how can I load the settings from one receiver into the other?

You want to write a settings file from receiver A into receiver B.

1. Read with "File" -> "Read from receiver" the settings from receiver B.

2. Click with the right mouse button into the satellite list and choose the function "Save satellite configuration".

3. Load the settings file from receiver A with "File" -> "Open" in SetEdit.

4. Click with the right mouse button into the satellite list and choose the function "Load satellite configuration".

5. Write this settings file into receiver B with "File" -> "Write into receiver".

You can read chapter 3.j for more details.

How can I add the same list with my favourite channels to different settings lists?

Please create a favourite list with these channels and save this list to your hard disc with the export function of the favourite lists menu. Then you can insert this list in every settings file you want with the import function of the same menu (see chapter 3.d).

I have registered SetEditTopfield5000 and I want to create settings for my Humax receiver. Why do I always get the message "Unregistered demo version" when I start the program?

You have to register SetEdit for every receiver separately.

I registered version 1.00, but on the homepage I found the version 1.05 Do I have to buy a new registration key?

No, you don't have to buy a new registration key. Just download the upgrade from the site www.setedit.de and install this upgrade in your already existing SetEdit directory.

I want to write Humax settings into my Topfield receiver. How can I do this?

Load the Humax settings into the corresponding SetEdit editor and convert them with File -> Convert to -> Topfield into the format you need for your Topfield receiver. Now you can write these settings into your Topfield receiver (see chapter 3.j).

I want to write Humax settings into my Topfield receiver. Do I have to register both versions?

You only have to register the version you need to write into the receiver. In the example this is the Topfield editor.

When I read from the receiver I get the message "Error loading file".

Maybe the transfer has failed, please try again. If you still get this error message, please send me the file SetEditxxxRead.logc (to Wolfgang.Litzinger@setedit.de). You find this file in your SetEdit directory.

How do I find my SetEdit directory?

If you don't remember where you have installed SetEdit, please click on the Help button and choose the function "Show SetEdit directory". A window with your SetEdit directory will be opened.

How can I watch scrambled channels?

You have to buy the corresponding pay-tv subscription!

Where do I enter the keys for the emu?

This is not possible. You have to buy the corresponding pay-tv subscription!

Does SetEdit work with a patched receiver software?

SetEditPingulux is only tested with the original version of the receiver firmware. If you have changed the receiver firmware, I can't guarantee that the program will work properly.

I would like to make a channel search on position 28.2° E with my receiver. How can I find out which satellite I have to choose?

Please click with your right mouse button in the satellite list and choose the function "Hotbird -> 13.0E Hotbird". The position of each satellite will be added at the beginning of each satellite name. Now - after writing these settings into your receiver - you can easily find the right satellite.

How can I add another receiver?

1. Select on my homepage the receiver you want to add.

2. Download the upgrade (zip file).

3. Extract the zip file and enter the directory of your SetEdit installation as destination directory.

4. Close all SetEdit editors and restart the program.

You can read chapter 2 for more details.

I have started SetEdit two times and want to copy channels from one window into the other. Why is this impossible?

You have to start SetEdit only once and then open with File -> New a second editor window. Now you can easily drag and drop channels from one window into the other.

SetEdit is hanging, I can't do anything.

Sometimes it may happen that an error message or a dialog window is hidden behind the main window. With the short cut Alt-Esc you can bring it in the foreground.

Where can I get help if I have other problems?

If you have any other problems please feel free to contact me by e-mail. Please note for all problems the exact version of SetEdit you use (see Help -> About SetEditPingulux).

My e-mail address is Wolfgang.Litzinger@setedit.de

Please **don't** call me to tell me about problems. There is no phone support.

7 Register

You can get your registration key for 24,99 € from me. I need your full name and your e-mail address. I can't send you the registration key by post.

In the demo version you can only change 20 channels. After this you can neither save your settings nor write them into your receiver.

Note: **Without your e-mail address and your full name I can't register you for SetEditPingulux.**

To register for SetEditPingulux there are 3 possibilities:

1. You send me the money in cash (by registered letter).

My address is:
Wolfgang Litzinger
Frontalstr. 42
67693 Fischbach/Germany

2. You can make a direct money transfer.

Note: If you transfer from outside Germany please make sure that you pay the fees for international money transfer.

My account is:
Account number 44 609 52 00
Bank name: Bank 24
Sort code: 380 707 24
Bank address:
P.O. box 24
Karl-Legien Str. 188
53244 Bonn/Germany
SWIFT: DEUT DEDB XXX
IBAN: DE66 3807 0724 0446 0952 00

Please use as the reason for payment your name, the editor version you wish to order and add a random number (e.g. your zip code, phone number etc.).
Example for a reason for payment: Charles Brown SetEditPingulux 12:56

Please send me an e-mail when you have transferred the money. The body of the mail should contain your name, the editor version you wish to order (here SetEditPingulux) and the random number you wrote in the reason for the money transfer.

Example for an e-mail text: Order for SetEditPingulux, Charles Brown, 12:56

Please check if you e-mail address is valid (e.g. by sending an e-mail to your own address). Unfortunately it happens sometimes that I want to send someone an e-mail with the registration key but the e-mail comes back undeliverable because the return address is not correct.
Please make sure that your name is in the e-mail (there are often e-mails like "from: superman@aol.com, I have sent you money today please sent me the editor"). In this case I can't relate your mail with my bank account.
Please don't try to write your e-mail address to the reason of the money transfer, special characters like "@" and "_" are not valid for this.

Please don't sent me pictures of your transfer sheet or online banking program, you will get the key as soon as I have the money on my bank account, I check my account every day.

If you get no e-mail from me after 7 working days, please contact me by e-mail. Either I could not assign your money transfer to someone or something is wrong with your e-mail address.

3. You can also use the online shop on my homepage to pay by Visa/MasterCard or PayPal.

Back to Contents.

8 Glossary and abbreviations

Baud rate: The speed at which data is transferred via the serial port to the receiver. The number is in bits per seconds.

Decimal/Hexadecimal: Hexadecimal is a system for representing numbers in base 16, rather than the base 10 we normally use. The hexadecimal system requires 15 digits and a zero; conventionally the letters A-F are used to represent the digits for that the decimal system cannot provide equivalents. Hexadecimal notation is not usually important for the PC user (with the possible exception of specifying base addresses) but is still quite important for the programmer. Its importance arises because there is a very close correspondence between hexadecimal and the very important binary numbering system that computers use internally. However, hexadecimal notation is much more compact than binary.
The reason why you can select both systems in SetEdit is that many satellite operators use "even" hexadecimal PID numbers. For example the audio PIDs on Astra transponder 11720 are in decimal notation 256, 512, 768, 1024, 1280 etc., whereas in hexadecimal notation they are 100, 200, 300, 400 etc.

DLL: Dynamic Link Library. A Windows library file that can be shared by multiple applications.

FEC: Forward Error Correction. A system, in which redundancy is added to the message so that most errors can be corrected dynamically at the receiver. Usual values are 1/1, 1/2, 2/3, 3/4, 5/6 and 7/8. 3/4 means that 3 out of 4 bits are reference data and the remaining one is for error correction.

LNB: Low Noise Block (converter). Amplifies received signals and converts them from microwave to lower frequency signals that are then sent along a cable to the satellite receiver. An LNB can be either single or double. A double LNB is required when more than one receiver is used allowing the viewing of different satellite channels on other television sets.

PID: Program Identifier. A 13-bit code in the transport packet header. PID 0 indicates that the packet contains a PAT PID. PID 1 indicates a packet that contains CAT. The PID 8191 (all 1 bits) indicates null (stuffing) packets. All packets belonging to the same elementary data stream have the same PID. The most important PIDs are the Video PID (for the video information), the Audio PID for the sound and the PCR PID (Program clock reference) to get Video and audio synchronous.
If you enter an existing Service ID for a channel, the receiver can get all necessary information for this channel. If you only enter the video and the audio PID, it may happen that you see the picture and hear the sound, but EPG does not work because this information is transmitted on a different PID. Usually the receiver finds the PIDs automatically, but occasionally (exotic channels) you have to know them and enter them by hand.

Symbol rate: The amount of digital data that is transmitted per second via a transponder. This is specified in Msymb/sec (Mega symbols per second), whereby a "Symbol" consists of 4 bits. The symbol rate together with the FEC value can be used to calculate the bandwidth of a transponder.

Polarity: A satellite transmission signal has either a vertical, horizontal, or circular orientation; a satellite can be all vertical or all horizontal; if a satellite is cross polarised, it can transmit both ways and therefore has twice the delivery capacity.
Besides the horizontal and vertical polarisation we also find the circular polarisation. Circular polarisation is not as easy to understand as linear polarisation, you can imagine that the waves are rotating clockwise or anticlockwise. In this case we speak about LHC and RHC (left hand circular and right hand circular).
As a rule in Europe linear polarisation (horizontal and vertical) is used. In Scandinavia and for C-band reception circular polarisation is used.

Select: To select a channel please click with the mouse on the channel. To select more than one channel you can use the usual windows methods.
When you press the shift key and click on a channel all channels between the currently selected and the last selected channel are selected.
If you press the Ctrl key on the keyboard you can add single channels to your selection.

Settings are the part of the memory of your receiver where all channel information is stored. It contains all channel information such as sequence, channel name, frequency, symbol rate, FEC, and all other parameters.
